TufTile® INSTALLATION INSTRUCTIONS
WET-SET (REPLACEABLE)

2. The concrete physical properties need to comply with the project's specifications. The proper slump range will ensure TufTiles maintain a solid connection with the cured concrete.

3. For Radius or Connected Tiles, see below. For normal tile install, do not remove protective plastic covering from TufTile until it's installed and concrete is fully cured.

4. Slowly press the TufTile into the wet concrete until the base of the truncated domes is flush with the concrete. (Figure 1) Do not stand on the tile during installation. (TufTile polymer products are not recommended for asphalt installations)

5. To ensure proper integration between TufTile WS anchors, “Concrete Keepers™, and the concrete it is important to tap the entire TufTile surface with a rubber mallet. (Figure 2) “Concrete Keepers™ are a feature of TufTile polymer products only.

6. OPTIONAL: In drier or wetter concrete mixes a weight like a sand bag or block may be laid on top of the installed tile to hold the tile at the desired depth and prevent it from "floating" during the curing process.

7. IMPORTANT! WHILE THE CONCRETE IS WORKABLE, AN 1/8” DEEP TROWELED EDGE MUST BE INSTALLED AROUND THE TILE PERIMETER. (Figure 3)

8. Finish the concrete as required in the specifications. Do not stand or walk on the TufTile until the concrete is fully cured.

9. Remove protective plastic sheeting after all post-installation treatments are complete and the concrete has cured. (Figure 4) TufTile's protective film does not wrap under the tile and can be fully removed. Your TufTile installation is now complete.

Radius or Connected TufTile® Installation

Instead of Step 3 above, do the following:

3. Peel back the protective coating on the tile edges.
3a. Remove anchors from edges that join.
3b. Insert Radius or Connector part between the tiles.
3c. Re-install anchors through tile and Radius or Connector.
3d. Locate the complete surface in position over wet concrete

Resume installation at Step 4 above
